PRODUCT CATALOG

Dear Clients,

PrJSC «POLTAVA DIAMOND TOOLS» has been manufacturing diamond and CBN tools for different industries since 1966.

Our specialists have researched & developed many solutions in various industries for the processing of hard-to-machine materials: from hard metal and superalloys to glass, stone and concrete.

This catalog includes resin, metal and vitrified grinding wheels and dressing rollers in the most popular shapes and dimensions. This is small part of the company's total assortment of more than 20,000 items.

Products are manufactured in different quality lines, each product of which is specially designed for its application.

PREMIUM is high performance quality line of diamond and CBN grinding wheels specially designed for use on CNC machines and grinders. PREMIUM grinding wheels have long life time, high surface quality and high performance.

EXPERT - resin bonded diamond and CBN grinding wheels for various applications in manufacturing processes for CNC and semi-automatic machines. Wheels of EXPERT line have increased performance, tool life and surface quality comparing with STANDARD resin bonds.

STANDARD resin, vitrified and metal bonded diamond and CBN grinding wheels are suitable for wide range of applications on various types of equipment.

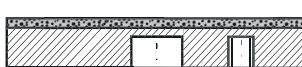

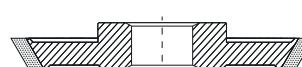

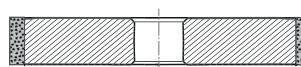

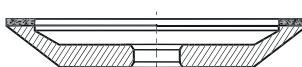

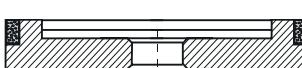

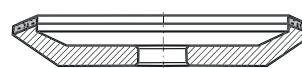

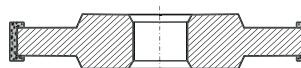

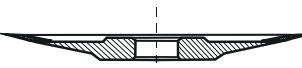

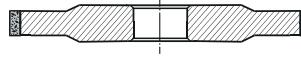

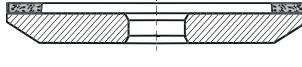

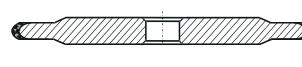

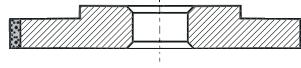

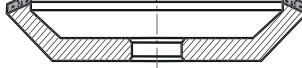

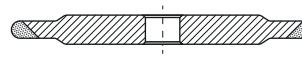

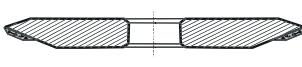

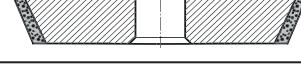

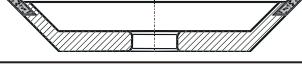

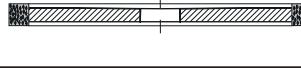

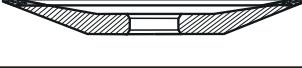

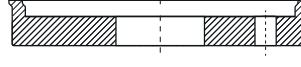

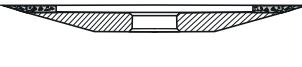

STANDARD wheels have high surface quality good tool life and good performance.

Thanks to innovative production technologies, we provide our customers with professional tools that provide clients maximum benefits. We guarantee the high quality of our products.

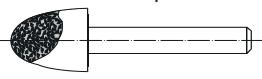

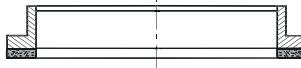

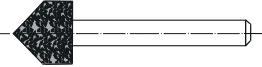

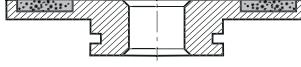

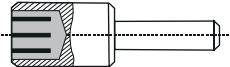

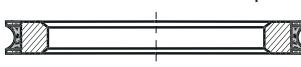

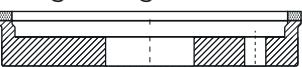

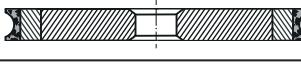

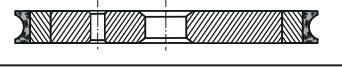

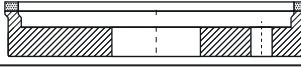

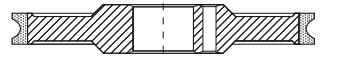

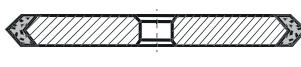

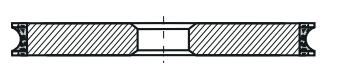

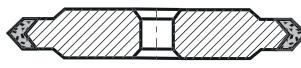

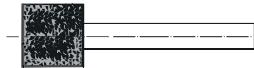

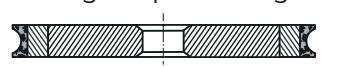

We look forward to cooperate with you!

APPLICATION OF DIAMOND TOOLS AND THEIR ADVANTAGES OVER ABRASIVE TOOLS

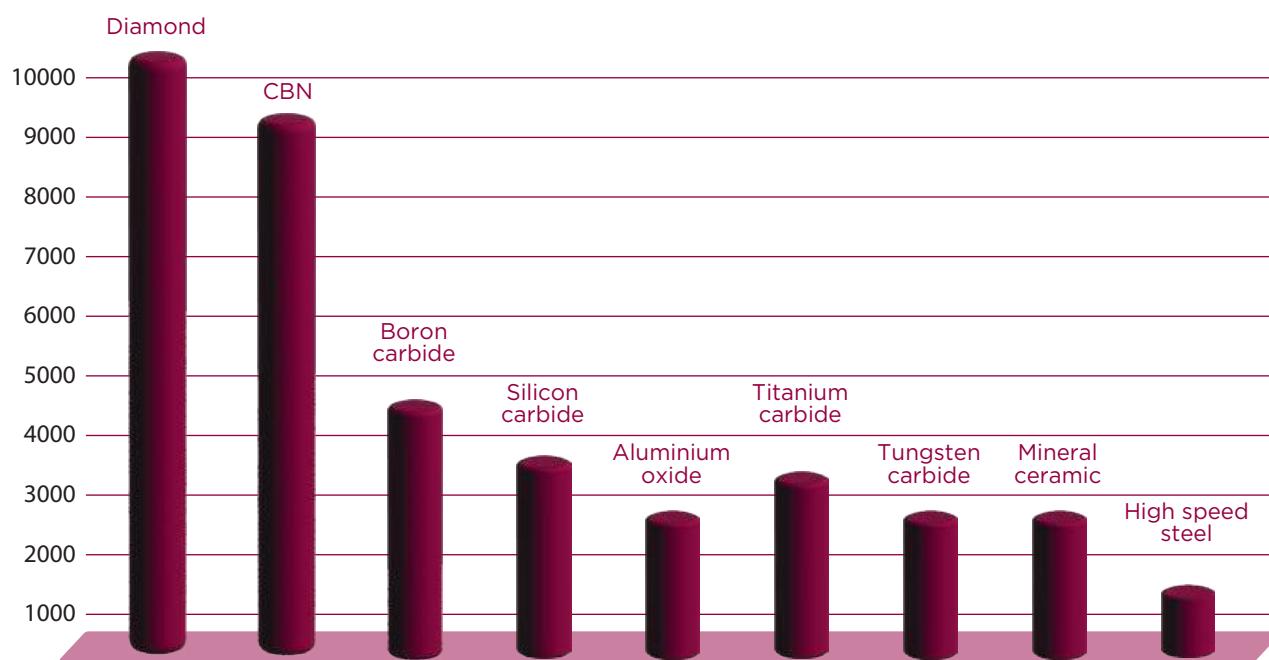

Applications of diamond tools

- Processing, sharpening and finishing of tools made of all alloy types. Sharpening and finishing of carbide tools. Processing and cutting of silicon, germanium and other semiconducting materials.
- Processing, cutting and finishing of tools made of ferrite, ceramic and glass materials.
- Processing of graphite and carbon reinforced plastics. Processing and cutting of reinforced fiber glass plastics, fiberplastics.
- Finishing and polishing of precious stones.
- Cutting, finishing and polishing of artificial and natural stones.
- Processing of all types of decorative and technical glasses and porcelain. Cutting and processing of all types of refractory materials.

Advantages of diamond grinding tools over abrasive tools

- High wear resistance.
- Workpiece life longer after diamond tool profiling.
- Less thermal workpiece damage due to lower temperature in grinding zone. Longer lasting, hence reduced changeover times.
- Higher volumes at the same level of quality.

Physicomechanical characteristics of abrasive tool materials

FEPA - ISO 6106-2005 standard, issued according to FEPA (Federation of European Producers of Abrasives) recommendations.

MESH - ANSI b74.16 American standard.

GRIT SIZE CLASS - it is an indicative description that refers to precision grinding.

CONCENTRATION OF DIAMOND GRAIN IN THE DIAMOND LAYER

The concentration of diamond grain is the content by weight of diamond in the diamond layer. The unit of weight for diamond grain is a carat (ct), i.e. 0.2 g. The diamond concentration is one of the most important characteristics of a diamond tool, determining its cutting ability, productivity, length of usage and cost. The choice of concentration depends on the type of tool, the form and size of the working surface, the diamond grit size, the wear-resistance of the bond, and the conditions in which the tool will be used.

The following are guidelines for the choice of diamond concentration in the diamond layer:

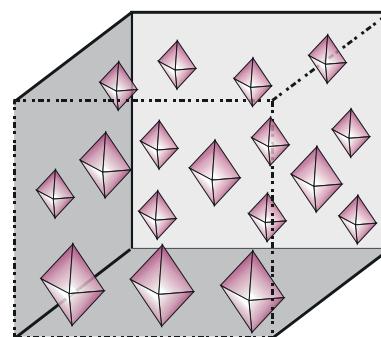

- for a small contact surface between the grinding wheel and the workpiece, for example as in circular grinding, a high diamond concentration should be chosen. This provides higher wear resistance for the wheel, even at high loads.
- a large contact surface necessitates lowering the grinding temperature and the grinding intensity. In this case a lower diamond concentration should be used.

Wheels are produced with diamond concentrations of 25%, 50%, 75%, 100% and 150% (It is possible to produce wheels with other concentrations if needed by the customer.)

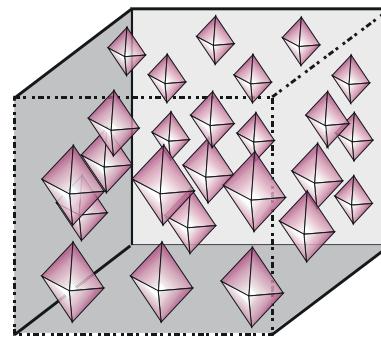

Diamond concentration by weight in the diamond layer					
Diamond concentration	25%	50%	75%	100%	150%
Diamond weight in carats per 1 cm ³ of the diamond layer, (ct/cm ³)	1,1	2,2	3,3	4,4	6,6

Diamond content by volume in the diamond layer (%)					
Diamond concentration weight	25%	50%	75%	100%	150%
Diamond volume in the diamond layer (%)	6,25	12,5	18,75	25,0	37,5

Low concentration of diamond grain

High concentration of diamond grain

Grinding with and without coolant

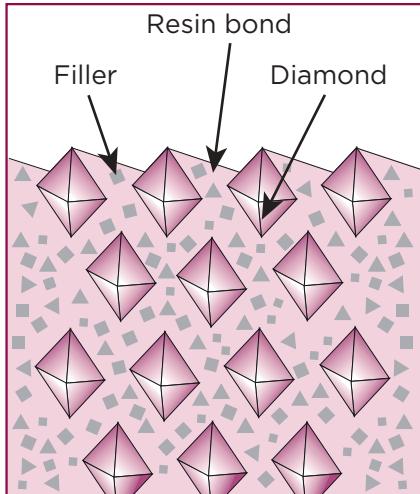

Grinding with coolant is to be preferred, since the grinding wheel is subject to less wear and can be used under more demanding conditions, thus increasing grinding productivity.

In addition, the probability of thermal damage to the workpiece (the appearance of burn marks) is reduced.

Liquid coolants are recommended as coolants for diamond grinding wheels.

BOND TYPES FOR DIAMOND TOOLS

Resin Bond, Metal Bond, and Electroplated Diamond Tools

Resin bond

Structure of the diamond layer:

- Diamond.
- Resin bond.
- Filler.

Characteristics:

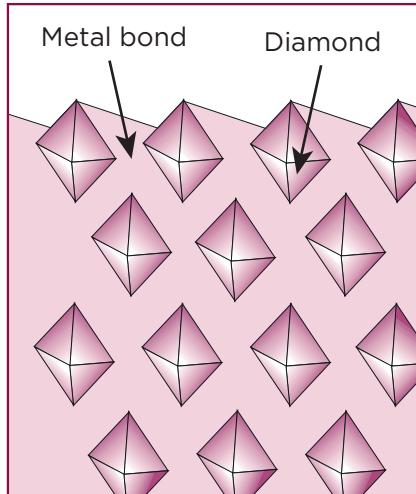

- Relatively low bond hardness.
- High removal productivity.
- Reduced work time.
- Low thermal conductivity and thermal stability.

Application:

Resin-bond wheels are used for fine and finishing operations, the fine sharpening and finishing of tungsten carbide cutting tools and superabrasive materials, and fine grinding and finishing of measuring and medical tools and workpieces of hard materials.

Grit size range:

D213 to D46 M63 to M6.3

Metal bond

Structure of the diamond layer:

- Diamond.
- Metal bond.

Characteristics:

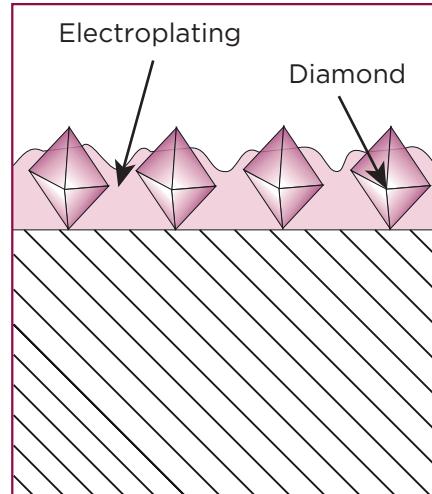

- High removal productivity.
- Significant bond hardness.
- Reduced work time.
- High thermal conductivity and thermal stability.

Application:

Metal bond wheels are used in preliminary operations that require the removal of material with relatively large tolerances, the sharpening of tungsten carbide tools, the grinding of tungsten carbide workpieces, profile grinding, cutting and grinding workpieces of specialty ceramics and hard to machine materials.

Grit size range:

D251 to D46 M63 to M6.3

Electroplated

Structure of the diamond layer:

- Diamond.
- Electroplating.

Electroplated diamond wheels are characterized by a single or multiple -layer diamond and nickel coating on a supporting metal body. The separate diamond crystals are connected by a layer of nickel, the thickness of which is about 2/3 that of the grain. Thus the diamond is reliably fixed but protrudes well beyond the surface of the electroplating, thus allowing for the removal of shavings.

Characteristics:

- High cutting ability.
- Can be made in any shape..
- Relatively low cost.
- High thermal conductivity.

Application:

Electroplated wheels and tools are used for cutting and grinding silicon, germanium and other semiconductor materials, glass-ceramics, various types of technical glass, texturing of stone. Electroplated tools are widely used in the production of mounted diamond wheels and points, various forms of lapping tools, the production of hand tools for finishing tungsten carbide dies, die and alloy steels.

Grit size range:

D251 to D46 M63 to M30

CHOICE OF GRIT SIZES FOR WHEELS USED TO GRIND AND SHARPEN TUNGSTEN CARBIDE

Type of Bond	Recommended range of Grit sizes	Roughness of workpiece surface, Ra, µm		
		For face grinding and sharpening	For flat grinding	For circular grinding

BOND TYPES AVAILABLE FOR SUPERABRASIVE WHEELS AND TOOLS

Bond name	Product line	Recommendation for usage	Recommended grinding depth per 1 pass, mm
PREMIUM is high performance quality line of diamond and CBN grinding wheels specially designed for use on CNC machines and grinders. PREMIUM grinding wheels have long life time, high surface quality and high performance			
Resin bonds of Premium line for sharpening of tungsten carbide and steels on CNC grinders			
B9-00	PREMIUM	High-performance tool sharpening on all wheel shapes, mainly on CNC machines with coolant, mainly oil, but also works well with emulsion. The bond has sufficient edge resistance and performance / durability ratio.	0,06-0,15
B7-00	PREMIUM	High-performance tool sharpening on all wheel shapes, mainly on CNC machines with coolant, mainly oil, but also works well with emulsion. The bond has good edge resistance and higher lifetime than 89-00 bond.	0,06-0,15
Resin bonds of Premium line for tungsten carbide and HSS tools production on CNC grinders			
B6-02	PREMIUM	High-performance, wear and edge resistant bond for diamond with high demand of processed surface. Designed for wheels with angular and radial working layers. Has high cutting ability.	0,05-0,3
B6-04	PREMIUM	High-performance, wear and edge resistant bond for CBN with high demand of processed surface. Designed for wheels with angular and radial working layers. Has high cutting ability.	0,05-0,3
HSS01	PREMIUM	Used for sharpening and production of HSS saw blades for 14F1 CBN wheels. For CNC machines with coolant	
Resin bonds of Premium line for flat and cylindrical grinding of tungsten carbide and HSS on CNC grinders			
B1002	PREMIUM	For cylindrical and flat grinding of tungsten carbide and HSS with coolant for 1A1 and 14A1 wheels.	0,005-0,05
B1003	PREMIUM	For cylindrical and flat grinding of tungsten carbide and HSS with coolant for 1A1 and 14A1 wheels. Has better surface roughness and lifetime than B1002.	0,005-0,05

BOND TYPES AVAILABLE FOR SUPERABRASIVE WHEELS AND TOOLS

Bond name	Product line	Recommendation for usage	Recommended grinding depth per 1 pass, mm
Premium metal bonds for glass beveling and edge processing			
GI101	PREMIUM	GI101 bond is the solution for glass beveling and used on 6A2 shape. This bond has increased wheel life and grinding performance comparing with M2-01, M-300, M3-04 and other STANDARD metal bonds.	0,3-1,5
GI201	PREMIUM	GI201 bond is the solution for glass edging (flat, pencil, radius and other types) and used on 1F6V, 1DD6V shapes. This bond has increased wheel life and grinding performance comparing with M2-01, M-300, M3-04 and other STANDARD metal bonds.	0,3-1,5
EXPERT resin bonded diamond and CBN grinding wheels for various applications in manufacturing processes for CNC and semi-automatic machines. Wheels of EXPERT line have increased performance, tool life and surface quality comparing with STANDARD resin bonds.			
Diamond resin bonds of Expert product lines for processing tungsten carbide			
EXD1	EXPERT	Fine and finish grinding of tungsten carbide. Similar in operation with B1-13 and STD1 bonds, but has higher performance (30% higher than B1-13 bond and can work at higher grinding parameters). EXD1 has good edge retention and used with and without coolant. Lifetime is 1.5-2.5 times higher than B1-13 (the percentage of lifetime increase depends on specific grinding parameters).	0,02-0,1
EXD2	EXPERT	Soft fine and finish grinding of tungsten carbide. Similar in operation with B2-01 and STD2, but has higher performance (40% higher than B2-01 and can work at higher grinding parameters). EXD2 has the same softness, used with and without coolant. Lifetime is 2-3 times higher than B2-01 (the percentage of lifetime increase depends on specific grinding parameters).	0,02-0,08
CBN resin bonds of Expert product lines for processing hardened and alloyed steels			
EXB1	EXPERT	Fine and finish grinding of steels. Modernized and better modification of BN310 bond. It runs smoother and show 30% higher performance, can work at higher grinding parameter. Has lower temperature in grinding area and as consequence less burns. Can be used with and without coolant. Lifetime is higher by 40-60% than BN310 (the percentage of lifetime increase depends on specific grinding parameters).	0,02-0,06
EXB2	EXPERT	Fine and finish grinding of steels. Modernized and better modification of BN130 bond. Show 30% higher performance, can work at higher grinding parameters with sufficient edge resistance. Has lower temperature in grinding area and as consequence less burns. Can be used with and without coolant. Lifetime is 2-2,5 times higher than BN310 bond. Better applied for the wheels for face grinding.	0,02-0,06
EXB3	EXPERT	Fine and finish grinding of steels. Modernized and better modification of BN130 bond. Show 30% higher performance, can work at higher grinding parameters with sufficient edge resistance. Has lower temperature in grinding area and as consequence less burns. Can be used with and without coolant. Lifetime is 2-2,5 times higher than BN310 bond. Better applied for the wheels for radial grinding.	0,02-0,06

Bond name	Product line	Recommendation for usage	Recommended grinding depth per 1 pass, mm
STANDARD resin, vitrified and metal bonded diamond and CBN grinding wheels are suitable for wide range of applications on various types of equipment. STANDARD wheels have high surface quality good tool life and good performance.			
Diamond resin bonds of Standard product lines for processing tungsten carbide			
B2-01	STANDARD	Soft fine and finish grinding of tungsten carbide with and without coolant.	0,005-0,06
B1-13	STANDARD	Fine and finish grinding of tungsten carbide. In its composition there are special metal components which ensure better edge resistance than B2-01 bond. Used mainly with coolant, dry application is acceptable.	0,005-0,06
STD1	STANDARD	Fine and finish grinding of tungsten carbide. Modernized and better modification of B1-13 bond. Increased performance by 10%, can work at higher grinding parameters. Has the same hardness and edge resistance, used with and without coolant. Lifetime is higher by 20-30% than B1-13 bond (the percentage of lifetime increase depends on specific grinding parameters).	0,02-0,08
STD2	STANDARD	Soft fine and finish grinding of tungsten carbide. Modernized and better modification of B2-01 bond. Increased performance by 20%, can work at higher grinding parameters. Has the same softness, used with and without coolant. Lifetime is higher by 10-25% than B2-01 bond (the percentage of lifetime increase depends on specific grinding parameters).	0,02-0,07
CBN resin bonds of Standard product lines for processing hardened and alloyed steels			
BN130	STANDARD	Fine and finish grinding of steels mainly with coolant. Has higher edge retention and lifetime than BN310.	0,02-0,04
BN 310	STANDARD	Fine and finish grinding of steels with and without coolant.	0,02-0,04
CBN vitrified bonds for processing hardened and alloyed steels			
XBCK4 XBCK5 XBCL4 XBCL5	STANDARD	Universal vitrified bonds are developed for fine grinding and finishing of stainless and hardened steels in flat and round grinding operations. Bonds have the property of preventing burns and sufficient wear resistance. Bonds are well-renewal, have a dense structure. Recommended for steels with hardness higher than 55 HRC. To obtain the best surface finish, a grain concentration of 100% is recommended for flat grinding and a concentration of 125% - for round grinding.	0,02-0,1
VBCN5 VBCM5 VBCO5 VBCP5	STANDARD	Bonds are developed for fine grinding and finishing grinding of steels. The temperature in the grinding zone is low. Bonds have the property of preventing burns and high edge resistance. Recommended for steels up to 55 HRC. It is recommended to use a grain concentration of 125% to obtain the best surface finish. Tool life of wheels with these vitrified bonds can be 5 times longer than for resin bonded wheels.	0,02-0,1
VBBM5 VBBN5 VBBO5	STANDARD	Universal vitrified bonds are developed for fine grinding and finishing of stainless and hardened steels . The temperature in the grinding zone is low. Bonds have the property of preventing burns, enlarged pores and work softly. They are well-renewal during the application. It is recommended to use a grain concentration of 125% to obtain the best surface finish. Recommended for steels up to 60 HRC. Tool life of wheels with these bonds can be up to 5 times longer than for resin bonded wheels.	0,02-0,1

Bond name	Product line	Recommendation for usage	Recommended grinding depth per 1 pass, mm
Diamond metal bonds of Standard line for processing tungsten carbide and iron-containing alloys			
M1-01	STANDARD	Machining of tungsten carbide, tungsten carbide together with steel, heat-resistant steels, and titanium alloys under heavy grinding conditions.	
M2-01	STANDARD	Flat, circular, internal, and longitudinal grinding of workpieces of hard non-metal materials-glass, ceramics, marble, granite, semiconducting materials-under normal grinding conditions.	
M2-02	STANDARD	Cutting of ceramics, glass, quartz, semiprecious stones and other non-metal materials. Harder and more wear-resistant than wheels using the M2-01 bond.	
M2-09	STANDARD	Grinding of titanium alloys, HSS, high-strength chilled, tempered cast irons.	
M-300	STANDARD	Machining of optical and technical glass. Higher removal rates than the M2-01 bond.	
M9-00	STANDARD	Processing of technical glass on mechanical feed lines.	
M3-00	STANDARD	Cutting of leuco-sapphire.	
M3-04	STANDARD	Machining of technical glass, crystal, semiconductors, ceramics, gemstones.	1/5 of grain size
M-310	STANDARD	Processing of technical glass and porcelain tile (ceramic granite tile).	
M3-08	STANDARD	Grinding and gem-cutting of natural diamonds.	
M3-10	STANDARD	Processing of brilliant girdle.	
M5-01	STANDARD	Honing of tempered and alloy steel.	
M5-04	STANDARD	Honing of steels and cast irons, finish honing of untempered steel, gray and alloyed cast irons.	
M5-05	STANDARD	Honing of alloyed steels, finish honing of tempered alloyed steels with a hardness of up to HRC 64.	
M5-06	STANDARD	Honing of gray and alloyed cast irons. Rough, fine, and finish honing of gray and alloyed cast irons with a hardness of HRC 40...50.	
M5-09	STANDARD	Machining of technical glass with mechanized feed. Higher removal rates than the M-300 bond.	

pdtools
SUPERABRASIVES

TOLERANCES FOR DIAMOND TOOLS

- for the hole diameter of A8 wheels..... H12
- for the hole diameter of other wheels..... H7
- for the outer diameter of 14EE1, 1EE1, 1FF1 wheels..... js14
- for the outer diameter of 14EE1, 1EE1, 1FF1 wheels..... js16
- linear measures up to 10 mm (3/8 in.)..... $\pm \frac{IT15}{2}$
- linear measurement higher than 10 mm (3/8 in.)..... $\pm \frac{IT14}{2}$

Tolerances for radial and axial run out of the working surfaces and the run out of the support surfaces of the wheels (except for A8 wheels) relative to the surface of the hole of the diamond wheel should be:

- For diameters up to 30 mm (13/16 in.)..... 8th degree of accuracy- GOST 24643
- For diameters greater than 30 mm (13/16 in.)..... 7th degree of accuracy- GOST 24643

Tolerances for the roundness of the outer surface of A8 wheels should correspond to the 9 degree of accuracy according to GOST 24643:

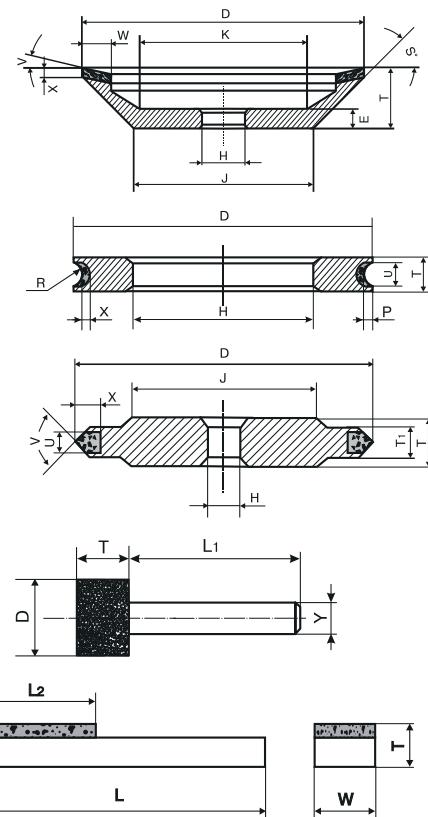

Nº	Outer diameter of A8 diamond wheels, mm	Outer diameter of A8 diamond wheels, inch	Roundness tolerances for the outer surface of A8 wheels
1	6...10	1/4...3/8	0,010
2	12...16	1/2...5/8	0,012
3	18...30	45/64...13/16	0,016
4	more than	more than	0,020

WHEEL PARAMETERS

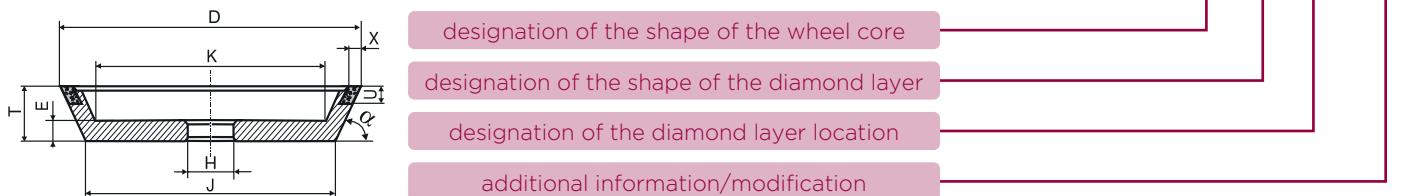

Parameters used in the catalogue are based on the FEPA standard for diamond tools:

- D** - top diameter
- E** - back thickness
- H** - hole diameter
- J** - hub diameter
- K** - inside diameter of flat
- L** - total stick length
- L₁** - spindle length
- L₂** - length of diamond layer
- R** - radius
- S** - face angle
- T** - wheel thickness
- T₁** - reduced hub thickness
- U** - insert length
- V** - face angle
- W** - rim width
- X** - depth of diamond layer
- Y** - spindle diameter
- P** - depth of concavity of diamond layer

Shapes of diamond grinding wheels

Diamond grinding wheels described in the catalogue are based on the FEPA standard for diamond tools.

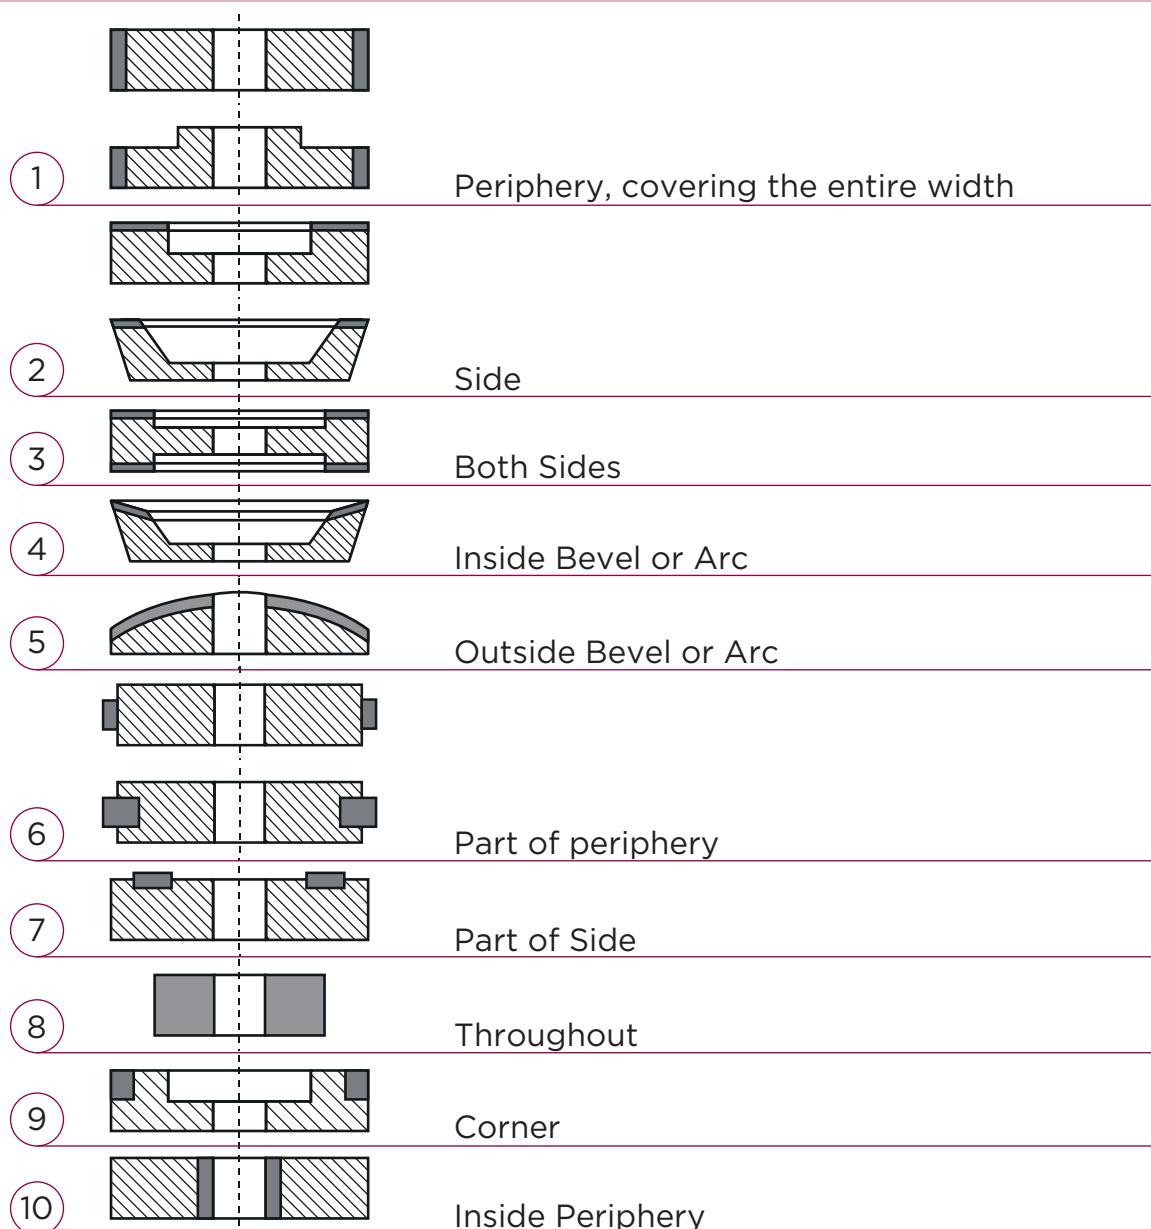

Identification number for shapes of grinding wheel cores

1		Flat wheel without recesses, $D/H \geq 1,8$
2		Rim wheel, face wheel, $D/H < 1,8$
3		Flat wheel with one-sided relief
4		Flat wheel with one-sided cone
6		Flat wheel with one-sided recess
9		Flat wheel with double-sided recess
11		Cup wheel $45^\circ < \alpha < 90^\circ$
12		Dish wheel $\alpha \leq 45^\circ$
14		Flat wheel with double-sided relief

RECOMMENDATIONS FOR THE USE, TRUING AND DRESSING OF DIAMOND WHEELS

When using diamond grinding wheels, the following instructions should be observed:

- Grinding wheels are to be mounted on holders or flanges and should not be removed until final usage has occurred. The tools are to be mounted securely on the machine spindle in accordance with the technical specifications of the equipment used for diamond tool machining.
- Metal bonded and vitrified bonded grinding wheels must be used with coolant, coolant is also advisable for resin bonded diamond wheels.
- The cleaning of resin bonded diamond wheels is to be performed with a pumice stone, of metal bonded wheels with a green silicon carbide bar made with grit sizes 1 or 2 sizes larger than that of the diamond wheel.

Dressing (truing) of the diamond layer is necessary to restore its shape, eliminate defects from its working surface, and to restore the required profile. As a rule this is performed without coolant. The most productive way of dressing a diamond layer is to grind it with abrasive wheels. The dressing is performed by wheels of white alumina and green silicon carbide with vitrified bonds with grit sizes 1 or 2 sizes larger than those of the diamond wheels. Wheels with a hardness of K-H are necessary for dressing of resin bond wheels and wheels of a hardness of M-K are necessary for dressing of metal bond wheels. The smaller the grit size of the superabrasive material, the softer the dressing tool must be.

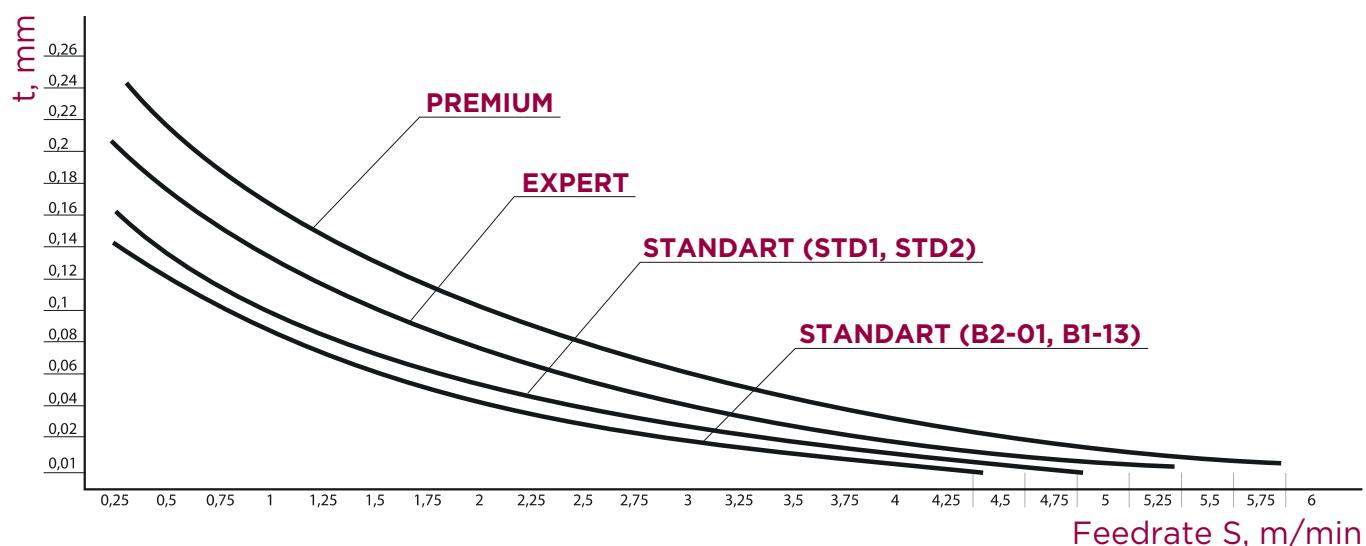

Conditions of diamond layer dressing

Diamond grinding wheel position	Dressing conditions			
	Peripheral speed, m/s		Line feed m/ min	Cross feed, mm/double stroke
	Abrasive wheel	Diamond wheel		
Diamond grinding wheel set on a machine fixture or in the center of a circular grinding or sharpening machine	25-35	1,0-2,0	1,0-2,0	0,02-0,04

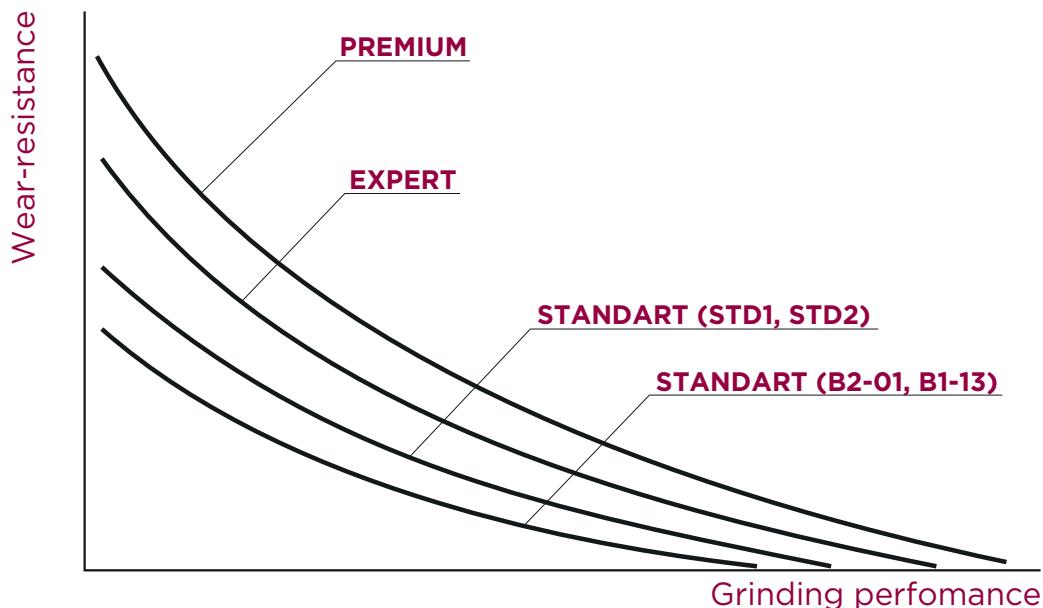

Characteristics of vitrified bonded abrasive wheels for dressing of diamond layer

Diamond layer characteristics		Characteristics of dressing wheel		
Type of bonds	Diamond grade, FEPA Standard	Abrasive type	Abrasive grades, FEPA Standard	Hardness
Resin bonds	D181-D126	Aluminum oxide	70-100	M-L
	D107-D76		100-150	L-K
	D64-D46		150-220	K-J
	M40-M16		360-400	J
Vitrified bonds, Metal bonds	D251-D213	Silicon carbide	46-54	O-N
	D181-D126		60-70	N-M
	D107-D76		80-100	M-L
	D64 and lower		120-180	L-K

**METAL AND RESIN BONDED DIAMOND
AND CBN GRINDING WHEELS FOR MACHINE
BUILDING, ELECTRONICS, TOOL AND
WOODWORKING INDUSTRIES**

1A1

STRAIGHT GRINDING WHEELS

1A1 D*T*X*H

Flat surface grinding

- Used for machining of conical, cylindrical and flat surfaces, cylindrical and conical apertures.
- Machining of cylindrical surface parts and surface ends at one set-up.
- Machining of recesses and slots of carbide stamps.
- Sharpening and finishing of carbide tools.
- The diamond layer is made of diamond grinding powder with metal or resin bonds.
- For metal bonded tools, coolant is required.

RECOMMENDATIONS FOR DIAMOND HONES

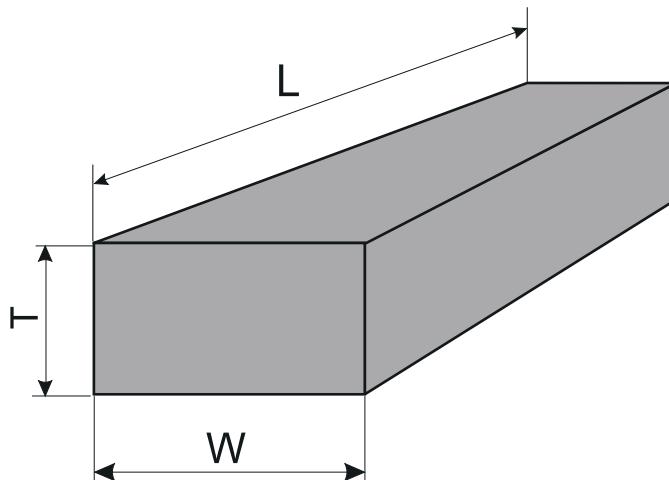

- Diamond hones are used for high-precision apertures, processing cast iron, steel and other machine parts such as cylinder blocks, cylinder liners, hubs for car and tractor engines, hydro-and pneumatic units, compressor cylinders, hubs for ship diesel engines, brake units, gears, connecting-rods, fuel pump hubs.
- The diamond layer is made of diamond grinding powder with metal or resin bonds.

**DIAMOND GRINDING WHEELS
FOR MACHINING OF GLASS,
CRYSTAL, DIAMONDS, CERAMICS**

MACHINING OF NONFERROUS MATERIALS WITH DIAMOND TOOLS

GLASS GRINDING

Diamond tools are used for glass grinding in a wide range of industries, including technical sheet glass processing, auto- mobile glass, optical glass, crystal and glassware.

Diamond wheels with semicircular and trapezoidal profiles, as well as with other profiles, are used for grinding glass surfaces. As a rule, diamond wheels that are electroplated and with metal bonds are used for glass surface grinding. The wheels are made with diamond powder types AC6-AC32 (synthetic diamonds) grit size D213 D64 with electroplating (nickel) or with metal bonds types M2-01, M3-04, M-300, M3-08.

For minimum wear of the diamond layer, diamond wheels should be balanced after being mounted on the spindle. It is not recommended to take the diamond wheels off the flange until they are fully used. Truing and dressing are necessary to restore the profile and the cutting properties of the wheels. Dressing is performed with a silicon carbide grinding wheel or electrolytes.

For automobile glass surfaces, the following parameters for diamond grinding are recommended:

Grinding speed, m/sec.....	25-30;
Glass feeding speed, m/min.....	3,5-5,5;
Wheel pressing strength, H.....	0,35-0,50;
Coolant usage (water based) is 10-15 l/min;	
Tolerances.....	0,2-0,3mm;

During the use of the wheel, its cutting properties become weaker, so it is necessary to increase the wheel pressure on the glass. If chips appear on the edge of the glass, the wheel must be dressed.

CRYSTAL GLASS PROCESSING

Diamond tools are widely used in the manufacture of crystal and glassware: edge grinding, grinding of flat surfaces and bases (wine glasses, etc.), sharp edge blunting (facet grinding), engraving, grinding of conical surfaces. For such purposes diamond grinding wheels 14EE1, 1EE1 with metal bonds are used.

The wheel size and type are chosen depending on the operation and the shape and size of the item to be machined. As a rule, medium sized and large items are processed on machines individually, small parts are processed on automatic machines with programmed designs.

Characteristics of diamond layers for decorative glass processing

Processing type	Workpiece	Diamond powder characteristics	
		Grade	Diamond concentration, %
Edge grinding with width up to 5 mm	Small and medium	D54	50
Edge grinding with width more than 5 mm	Medium	D64	
Edge pregrinding with width more than 8 mm	Medium and Large	D213 D181 D107	100
Edge finishing with width more than 8 mm	Medium	D54	50
	Large	D64 M40	50; 100
Engraving, cone engraving, fine faceting, drawing	Small	D54	50
	Medium	M63	
	Large	M40	

CRYSTAL GLASS PROCESSING (continuation)

To prepare the grinding wheel for usage is of great importance. It is to be checked thoroughly after storage: cracks, diamond layer peeling, and nicks are not acceptable. The wheel must be balanced after mounting on the flange, and after its placement on the spindle the wheel must be adjusted to avoid wear of the diamond layer.

The wheel profile angle as a rule is 90°, 110°, 130° or 140°. The characteristics of diamond wheels recommended for decorative and household glass are found in the table.

The articles have been divided into the following sizes:

Large vases with height more than 250 mm (10 in.), diameter 150 mm (6 in.), decanters with capacity more than 500 ml, Medium vases with height up to 250 mm (10 in.), diameter 150 mm (6 in.), decanters with capacity up to 500 ml, Small wineglasses, glasses, salt shakers, etc..

During hand drawing operations, water based coolant is always used in order to visually monitor the process. Mineral oil coolant as well as water coolant are used in machine drawing operations.

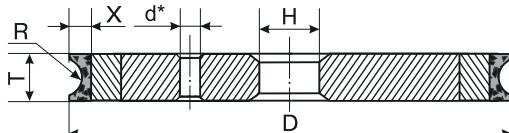

DIAMOND DRILLS

Diamond drilling is the most productive method of making a hole in friable, hard, nonmetallic materials. The most commonly used in industry are tubular drills consisting of a diamond rim crown, fixed in a cylindrical core (drill end). These tools remove material only on the rim surface. Usage of drills of this type helps to reduce axial load and to ease coolant supply to the cutting area. It provides high productivity and quality of processing and decreases diamond use.

Recommended rotational speed of drills for glass drilling

Drill diameter, mm	Drill diameter, inch	Rotational speed, RPM	Mechanical feeding, mm/min
1 - 3	0,039 - 1/8	6 000 - 24 000	20 - 50
3 - 6	1/8 - 1/4	3 000 - 12 000	30 - 60
6 - 15	1/4 - 19/32	2 600 - 6 000	30 - 50
15 - 25	19/32 - 1	2 000 - 4 500	25 - 40
25 - 50	1 - 2	1 200 - 2 500	20 - 30
50 - 100	2 - 4	500 - 1 200	10 - 20

In other types of drilling, the coolant is supplied to the work area though a tube inside the tool. As a rule, for the hand drilling of furniture, mirror and automobile glass, industrial water is used.

DIAMOND DRESSING ROLLERS

DIAMOND PROFILE DRESSING ROLLERS

Diamond profile dressing rollers are an integral part of modern grinding technology and are mainly used in serial and mass production. Diamond rollers are used for dressing of abrasive wheels.

With the help of diamond rollers, a copy of the profile of the required part is created on the surface of the working abrasive wheel. Then the abrasive wheel transfers this profile to the workpiece.

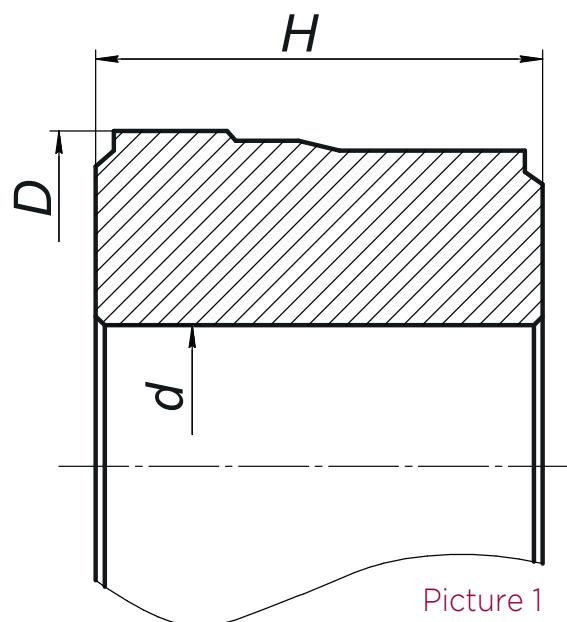

At the same time, diamond rollers allow to combine several processing transitions at once, including turning, milling and preliminary grinding.

The production program of **PDTOLS Superabrasives** includes the production of diamond rollers which are used for:

- crankshaft processing;
- processing of ball pins;
- grinding of piston rings;
- valve handling: -manufacturing of turbine blades;
- manufacturing of cogwheels; - manufacturing of threaded connections;
- manufacturing of details of the bearing industry.

Advantages in application of diamond profile dressing rollers:

- creation of the abrasive wheel's surface within minimum possible time;
- profiling the surface of the abrasive wheel in one operation;
- high accuracy even during the creation of very complex profiles.

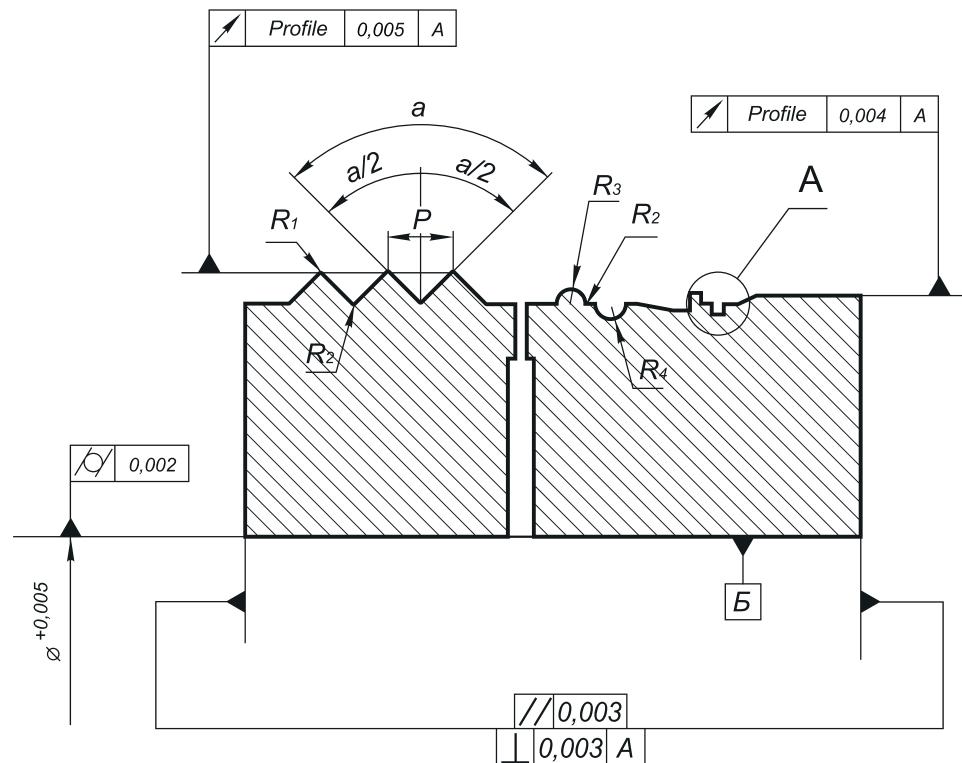

Picture 1

Table 1

Dimensions	Diamond roller Dimensions, mm O2H*	Diamond roller Dimensions, inch O2H*
D max	160	6 2/7
D min	65	2 5/9
H max	140	5 1/2
H min	10	3/8
d min	20	4/5

*O2H - the method of electroforming with a non-orientable arrangement of diamonds bonded with a metal bond. The ratio of the diameter of the diamond roller to its height should be no more than 0.9.

Minimum tolerances for the shape and arrangement of diamond roller surfaces

Picture 2

A

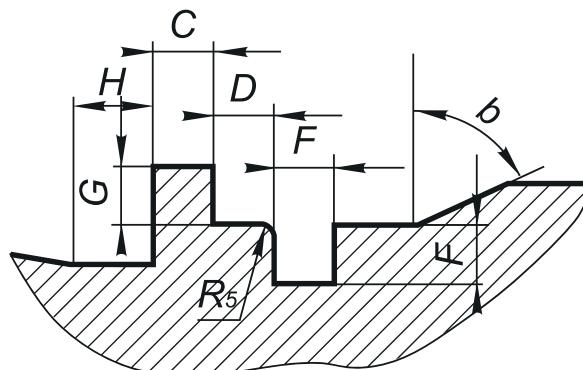

Table 2

$C = \pm 0,002$	$H = \pm 0,002$	$R_4 = 0,01$
$D = \pm 0,002$	$P = \pm 0,002$	$R_5 = 0,012$

VITRIFIED BONDED CBN GRINDING WHEELS

VITRIFIED BONDED CBN GRINDING WHEELS

The Application Area

- cylindrical grinding, flat grinding, internal grinding operations
- producing of details for bearing industry etc.
- sharpening of metal cutting tools
- gear grinding operations
- thread-grinding operations
- producing parts for turbine etc.

Main Processed Materials

- instrument steel (P18, P6M5 etc.)
- bearing steel
- titanium alloy
- heat-resistant steel
- alloy-treated steel

Recommendations for Wheel's Hardness Selection

Table 1. Types of hardness

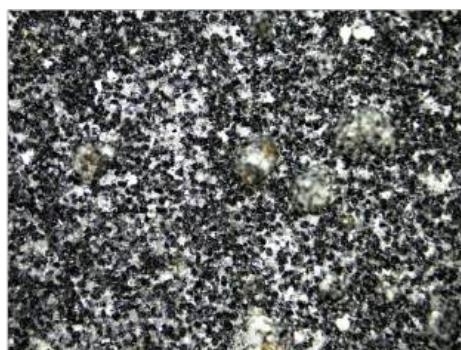

Group of Hardness	Designation in accordance with ISO Standards
Soft	J
	K
	L
Medium-soft	M
	N
	O
Hard	P
	Q
	R
	S

Main Rules for Vitrified Bonded Grinding Wheels Hardness Selection

1. Grinding of hard materials - soft bond. The soft bond also could be used for grinding of soft and yielding materials, such as heatproof and nonferrous alloys.
2. For rough grinding should be used wheels with harder bond.
3. In case of speed rising client should decrease the hardness of the bond.
4. In case of large contact of grinding wheel with processed surface should be used softer bond.

VBAO5 - normal porosity

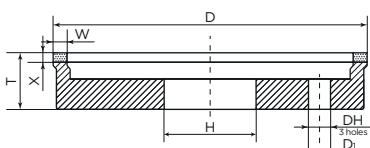

VBBO5 - extended porosity

GRIT AND BOND HARDNESS RECOMMENDATIONS FOR VITRIFIED BONDED WHEELS

Grinding method	GRIT size	Hardness
Surface grinding: Peripheral grinding, Ra 0,32 - 1,25 Face grinding, Ra 0,16 - 0,63	B91 ... B126 B54 ... B76	L - M K - L
Internal grinding:	B64 ... B126	O - R
Cylindrical grinding: In-feed grinding, Ra 0,32 - 1,25 Traverse grinding Ra 0,16 - 0,63	B126 ... B151 B54 ... B107	N - O M - N
Gear grinding: Module < 3 mm Module > 3 mm	B76 ... B91 B107 ... B151	L - N K - M

DIAMOND PASTES

DIAMOND PASTES

Diamond pastes are used for the finishing and polishing of ferrous and nonferrous metals, steels and semiconductors, alloyed steels, cast irons, ceramics, metal ceramics, carbide, sapphire, glass, semiconductors, and drawing dies.

Paste made of synthetic diamond ACH micropowders, grit size M40, with normal diamond volume content and washable by water would be marked as follows:
ACH M40 N W L.

Diamond pastes act on the workpiece surface chemically and mechanically. They form fine-dispersion emulsions that allow for a smoother distribution of diamonds over the workpiece surface. The paste also contains active surface agents, which make washing easier and help to remove slightly flammable liquids, chips and slag generated by the lapping process.

Pastes are produced with normal (N), higher (H) and extra-high concentration (E), depending on the volume content of diamonds and their grit size.

Volume content of diamond powder in diamond pastes

Diamond powder Grit size	Volume content of diamond in pastes, ct*			Color of paste and label
	N	H	E	
D126-D76	40	60	-	Lilac
D64-054	20	40	-	
M63-M40	8	20	40	Red
M25-M16	6	15	30	Blue
M10-M4	4	10	20	Green
M2,5-M1	2	5	10	Yellow
1/0,5-0,1/0 µm	2	5	10	Not colored

* The weight of carats is indicated for a 20 gram package.

We can also produce pastes with other diamond volumes, without color and with non-standard diamond grit sizes. Pastes are delivered to consumers in syringes of 5, 10, and 20 grams, in containers of 50 and 100 grams, or in cans of 500 or 1000 grams. On request other packing is possible.

Depending on their ingredients, pastes are classified as follows:

- (O) can be washed by organic solvents such as kerosene, petrol, alcohol, etc.
- (W) can be dissolved and washed off by water.
- (WO) can be washed off by water and by organic solvents, such as alcohol, industrial oils, petrol, kerosene.

Depending on grit size, pastes can be used for different finishes

Diamond powder Grit sizes	Surface roughness, Ra, µm		Operation
	Before	After	
D126-D54	-	-	Rough finishing
M63-M40	0,4 - 0,2	0,195 - 0,155

M16	47	97	148
M10	42	93	143
M6.3	37	82	137
M4.0	32	65	108

Applications of diamond pastes

Type of paste	Rinseability	Application
Г (G)	O	Machining of ferrous and non-ferrous metals, alloys, non-metal materials, steels and semiconducting materials.
Л (L)	BO	Machining of alloyed steels, cast iron, ceramics, cermet, tungsten carbide, ferrite, sapphire.
Х (H)	B, BO	Machining of glass, semiconducting materials, carbide tools, dyes.
Э (E)	BO	Machining of glass, semiconducting materials, carbide tools.

Attention! PDTools Superabrasives produces titanium carbide (TiC) pastes.

TiC abrasive pastes are used for the finishing and polishing of machine parts in the aviation industry, precision ball bearings, shut-off brake equipment, pneumatic equipment (plugs, valves, hydrocyclones), fuel equipment (seat plugs, valves), and tooling.

pdtools
SUPERABRASIVES

CUBIC BORON NITRIDE PASTES

Cubic Boron Nitride Pastes is produced for semi-finishing and finishing operations. It is used for finishing and polishing operations of carbon and alloy steel, chilled iron.

Past composition is next: cubic boron nitride powder, filler with organic oils, fatty acids, carbons of paraffin series and its derivate, polymer material, Cubic Boron Nitride Paste affects on processed surface with chemical and mechanical influence. The past composition consists of surface active materials, they help with washing workpieces, and output the slags from the processing surface.

It increases productivity and the roughness of the surface.

The paste divides:

"**N**"-normal consistency

"**H**"- higher consistency

"**E**"-extra-high consistency

We use the organic solvent: kerosene, engine oil, alcohol. The data for grit correspondence and abrasive facilities and roughness are in the table.

Grit size of CBN powder	The color of the paste and label	Abrasive capacity of steel processing HRC			Surface roughness (Ra), μm , not more

The paste is delivered to the customers in container of 40, 50 and 100 grams.

The other package for pastes is possible according to client's request.

Storage temperature $25 \pm 5^\circ\text{C}$.

CARBIDE TITANIUM PASTES

Abrasive Carbide Titanium Paste - consists of composition of classified according to carbide titanium powders grit sizes and surface-active materials.

The pastes are used for finishing and polishing of details for aerotechnics, high-precision bearing, blocking devices and pneumatic motor (cranes, faucets, hydraulic cyclones), fuel injection equipment (plunger pairs, valves), tool outfits and rough grinding of details and knots.

Abrasive pastes have grit sizes: micro grits D126-D54; micro powders M63-M4.0.

The paste concentration in accordance with part of carbide titanium powder are:

"**N**" - normal consistency

"**H**" - higher consistency

"**E**" - extra-high consistency

In accordance with consistence carbide titanium paste divide into:

"**M**" - salvelike

"**T**" - hard

The selection of grit size depends on type of processing

Type of processing	Grit size of paste, μm	Expenditure of paste, gr/sm^2	Roughness of surface (Ra), μm	
			Before processing	After processing
Rough processing	125/100-50/40	0,8-1,5	-	0,32
Semi-finishing processing	60/40-14/10	0,4-0,9	-	0,10
Finishing processing	14/10-3/2	0,2-0,6	-	0,032
Polishing	3/2-1/0	0,1-0,4	-	0,020

For diluting of pastes with oil base is recommended to use engine and aero oil, kerosene, gasoline; paste with water-washable base - alcohol, water.

The lap should be made of cast iron, latten, glass, wood (birch, oak, beech), felt etc.

The Abrasive capacity of pastes and the roughness of processed surface are in the table.

Grit size of carbide titanium paste	Abrasive capacity of paste, mg, not less		Roughness of surface (Ra), μm	
	N	H	Before processing	After processing
160/125	50	55	-	-
125/100	45	50	-	-
100/80	40	45	-	-
80/63	37	43	-	-
63/50	34	40	-	-
50/40	30	38	-	-
60/40	28	36	0,32	0,25
40/28	26	34	0,25	0,20
28/20	24	32	0,20	0,16
20/14	21	30	0,16	0,125
14/10	18	27	0,125	0,10
10/7	15	27	0,10	0,08
7/5	12	18	0,08	0,063
5/3	10	14	0,063	0,05
3/2	-	-	0,05	0,04
2/1	-	-	0,04	0,032

CHOICE OF MATERIAL FOR LAPS

Cast iron, steel, brass, bronze, wood, leather, and felt can be used as laps. The choice of a material for a lap depends on the material of the workpiece, its hardness and the required surface quality.

Cast iron has very high removal rates and can achieve the necessary surface geometry, but it gives a rougher finish than softer laps. Cast iron is used for lapping the very hardest materials with pastes of coarse grit sizes. The laps are produced with fine cast iron grit with low porosity.

Steel is used instead of cast iron when the hardness of cast iron is inadequate for a lap with a small cross section. Steel is used only for the removal of large volumes.

Brass and copper are best used with diamond paste made with medium grit sizes. To increase the hardness of the lap, steel cores are used. Bronze laps tend to load up at high temperatures and need to be moistened.

Wood of various types—from hard (hornbeam, beech, oak) to soft (birch, linden) hold diamond grains well and reduce the amount of paste used. Laps are made from cross sections of wood.

Glass is recommended for the polishing of semi-precious stones, corundum, granite, etc.

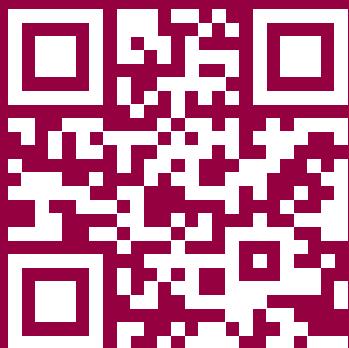

Fiber is used for laps that need to hold their shape when used with pastes of medium and fine grit sizes. The roughness of the surface finish with fiber laps is very low.

Leather and felt should be used only with pastes made of fine grit sizes for final surface finishing and for polishing to a mirror finish. These can be used in the form of revolving discs, mandrels or inserts with a back and forth motion.

In order to perform the finishing operations it is necessary for the lap to be charged so that the abrasive grain presses into its surface.

In one carat of diamond powder there are anywhere from several ten thousands to hundreds of billions of grains, therefore it is necessary to apply the optimal amount of paste to the lap, thus also keeping costs down. For each paste of a specific grit size it is necessary to use a separate lap. When going from a paste with coarse grits to one with fine grits, the workpiece must be thoroughly rinsed.
